About MPI

Based in Metro-Detroit Michigan, MPI designs, manufactures, and services magnets, material handling, and electronic inspection systems. MPI products are designed to be complete metal and foreign contamination control solutions for food production and related industries. MPI's safe and reliable equipment and service programs help customers minimize downtime and protect brand integrity. MPI leads the industry in customer service and innovation, continuously expanding its offerings to meet the needs of a dynamic marketplace.

Company Timeline

2021
MPI celebrates 40 years of business operations

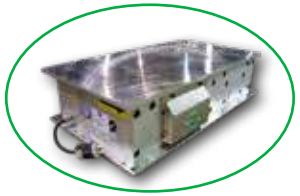
2020
MPI manufacturers and installs over 450 ft. of M-1000 Series Electric Scrap Shaker system for major tier one auto supplier

2019
Adds industrial workholding line to compliment the industrial product line

2017
MPI standardizes all equipment on American-made drive packages

2015
MPI begins offering service plans for continued product performance and maintenance

2010
MPI patents its first generation Electric Shaker and builds the world's longest single beltless magnetic conveyor - 101 feet



2006
MPI patents the sealless pneumatic shaker conveyor and sealless pneumatic beltless magnetic conveyor, and introduces its next generation Electric Shaker

1998
MPI introduces its pneumatic shaker

1995
MPI expands its manufacturing facility, doubling capacity again

1993
MPI relocates to Highland, Michigan to a state-of-the-art manufacturing facility, doubling capacity

1989
MPI patents the magnetic can-laner conveyor and builds its first Beltless Magnetic Conveyor

1981
MPI begins operations in Walled Lake, Michigan

Protecting and Moving the World Through Innovation

Keith Rhodes
MPI Founder & CEO

Kyle Rhodes
Vice President - Business Development

When you choose to buy from MPI you're not just buying a magnet. At its core, a magnet is designed to capture and retain unwanted tramp metal. When you choose an MPI magnet, you get so much more.

Over 40 years ago, MPI's founder realized that when he took time to explain magnetic technology, customers were delighted, and they obtained the results they were looking for. His vision was to start a company where both employees and customers were treated exceptionally well, and innovation was the new normal.

Thus, MPI was born, and today it is still under the same family ownership and unique set of values – treat people right, consistently develop high quality and innovative products, and lead the industry in customer education. We continuously invest in improving your business by developing new products designed to make a real difference to our customers. Through the years, MPI has invented innovative products, including the quick-cleaning and self-cleaning drawer magnets, as well as the electric low frequency shaker systems. We recently launched the world's first and only intelligent magnet, the Intell-I-Mag®!

MPI truly believes that it is our obligation to educate our current and future customers on magnetic technology. We say that *"an educated customer is an MPI customer."* We conduct presentations on the principles of magnetic separation for our customers, industry groups, and OEM manufacturers. The presentation qualifies as a course for Continuing Education Credits for Professional Engineers. In addition, our comprehensive, one-of-a-kind *"MPI Magnet Audit"* has given over a thousand companies valuable insights to help improve their metal control processes.

We recognize that industrial production facilities require quality tooling when manufacturing components. This is why MPI introduced the Automation and Workholding product line complementing our full line of metal control solutions. MPI offers lifting magnets, magnetic chucks, demagnetizers, sheet separators and magnetic filtration equipment - everything a shop needs to move and hold metal during manufacturing. We've also created a network of distributors throughout North America to support our customer's machining requirements.

Not only are MPI products the best in the industry, but we also make it easy for our customers to do business with us. With over 300 years of collective industry experience, our proven process ensures you get the right product, every time. Delivering exceptional customer service, MPI's experienced representatives and Regional Managers around the world come to your facility to meet with you and better understand your needs.

MPI Promise

To assure you that choosing MPI can be done with complete confidence, we stand behind our products with the industry's best policies and guarantees that make doing business with MPI easy and risk-free. The MPI Promise is like a benefits package that starts the moment you first speak with us and extends long after your equipment installation. When you do business with MPI we promise:

COMPLETE SATISFACTION

Our equipment will achieve the results for which they were designed and manufactured. If you encounter any issue, we will make it right. Family owned and operated since 1981, we stand behind our products and treat our customers like part of the family.

EDUCATION

You have the right to understand the technology you are buying, including the alternatives. We pledge a continuous focus on delivering customer education that empowers you with the information needed to select what is best for your application.

LIFETIME SUPPORT

For as long as you own an MPI system, MPI Metal Control Experts are on-call to provide technical support regarding installation, start-up, optimization and testing needs for your entire metal control system. We will even assist with your non-MPI brands.

THE CHIEF

Really, our head honcho cares about your experience with MPI. If you have any feedback you'd like to share here is your open invitation to contact our Vice President - Business Development, Kyle Rhodes, at rhodes@mpimagnet.com.

THE BEST QUALITY

Our products are built with the best available designs, material and workmanship to provide the best metal control results in your application. From concept to final product, we design our equipment to the highest standards with the lowest total cost of ownership.

24/7 SERVICE

2nd or 3rd shift need support? Our 24/7 service line connects you directly with an on-call MPI Expert. Call the main line at 1.248.887.5600 and press 9.

RELIABLE DELIVERY

Over the last 10 years, 99% of our shipments have been delivered on or before our promise date. If you need a product before our quoted lead time, let us know and we will do everything we can to make it happen.

FAIR PRICES

We are committed to providing premium products at the best value. If you receive a competitive quote with a lower price for an "apples to apples" product, we will match it - plain and simple.

Lifting Magnets

Lifting Magnets make moving material easier without deforming or damaging the load. MPI workholding tools are versatile, compact, and easy to operate. They replace ropes, chains, and clamps, providing more control with the strong force of a magnet.

MPI permanent lifters are the only product in the industry protected by a five-year warranty on the magnetic system. Our products are manufactured in Europe to the highest quality standards, meeting all ANSI/ASME B30.20 (safety standard) requirements.

An Air Gap test is conducted with an air gap that simulates real operating conditions to reveal true capacity. MPI offers annual lifter re-certification service to verify lifting performance, meet product specifications, and meet the requirements of your company's annual OSHA lifting safety compliance program.

Lifting Magnet Selection Guide

Lifting Magnet	Permanent	Battery BM	Battery BMP	Permanent Crane
Technology	Permanent	Battery	Battery	Permanent
Included with Each Magnet	-	12V battery, battery charger, and remote (Controller operates from up to 33' for safety)	12V battery, battery charger, and remote (Controller operates from up to 33' for safety)	-
Nominal Lifting Capacity Flat Material	up to 2,000kgs/4,409lbs	up to 5,000 kg/11,023 lbs	up to 3,600kg/7,936lbs	-
Nominal Lifting Capacity Round Material	up to 1,000kgs/2,204lbs	-	up to 2,200kg/4,850lbs	-
Horizontal Working Limit	-	-	-	551 lbs
Vertical Working Limit	-	-	-	176 lbs
Safety Factor	3:1	2:1	2:1	4:1
Magnetic System Warranty	5 year	1 year	1 year	1 year
Use	Flat, round, and cylindrical workpieces	Flat surface loads	Flat and round surface loads	Horizontal to vertical positions, vice versa
MPI Difference	Strong welded design features stainless steel lifting eye, welded to compact body, with only two recessed handle screws. Simple Easy Switch Handle switches magnet on and off easily, quickly, and safely with one hand.	Compact LED display with battery status indicator provides audio and visual warning of low battery level. The magnet will not activate once the battery voltage drops below the safety level lifting. Large steel lifting eye with safety bail sensor. Variable Force adjusts holding force when handling a particular quantity of sheet metals from a stack, with Tip-Off for gradual slackening portion of the load.	Compact LED display with battery status indicator provides audio and visual warning of low battery level. The magnet will not activate once the battery voltage drops below the safety level lifting. Large steel lifting eye with safety bail sensor. Variable Force adjusts holding force when handling a particular quantity of sheet-metals from a stack with Tip-Off for gradual slackening portion of the load.	Large, lockable lifting eye prevents undesirable tilting from horizontal to vertical positions, with a lockable release lever for comfortable and safe operation. First magnetic "claw" of its kind, in compliance with UNI EN 13155 standard for handling with a crane. Unique pole configuration reduces peel-off effect for thin sheets during handling.

Instructions for the Workload Limit Table for Plates and Rounds

1. Select your MPI Lifting Magnet model.

2. Select the surface finish and condition (clean and smooth, rusty or hot, irregular or rough) that corresponds to your plate or round bar. If your surface roughness exceeds the maximum, do not make the lift.

   Plates:
   a. Select the plate thickness from the table. If your plate thickness is not listed, select the next lower value from the table. Never lift plates thinner than the minimum listed in the table.

   b. Check that the plate you are attempting to lift is shorter than the maximum length (L) and narrower than the maximum width (W) listed in the table under the heading "Max. dimensions" for the thickness of the selected plate.

   Round bars:
   a. Be sure the diameter of the bar is between the minimum and maximum diameter as listed in the table. Never lift bars outside this range.

   b. Ensure that the bar is less than the maximum length (L) max listed in the table.

3. Determine the maximum safe lifting capacity of the magnet based on your material thickness.

   Plates:
   a. Select the maximum safe lifting value from the table for the minimum length (L) and minimum width (W) from one of the two choices. Do not make the lift if your plate is less than these minimum values.

   Round bars:
   a. The maximum safe lifting value is shown in the table.

4. If you are not lifting AISI 1020 steel, determine the reduction in safe lifting capacity by the percentage factor for your material from the Material Reduction Factor Table shown below. For example, if you are lifting cast iron, multiply the maximum safe lifting capacity determined in Step 3 above for steel by 45% to get the maximum safe lifting capacity for your lift of cast iron.

5. Finally, determine the weight of the plate or round bar you are attempting to lift to be sure it is less than the maximum safe lifting capacity determined in Step 4. The weight can be calculated using the density of 0.283 lbs per cubic inch for steel or by use of a commonly available on-line weight calculator.

Material Reduction Factor Table

The Workload Limit Table for Conditions and Finishes is for AISI 1020 steel. Other materials are less magnetic. Any increase in alloy content will reduce the safe lifting capacity of the magnet. Use these percentage factors for materials other than AISI 1020 steel:

Material	Percentage Factor
Cast Steel	90%
3% Silicon Steel	80%
AISI 1095 Steel	70%
416 Stainless Steel	50%
Cast Iron (non-chilled)	45%
Pure Nickel	10%

*WLL= maximum working load designed for certain lifting magnet capacity, with respect to minimal safety factor 4:1.

DO NOT LIFT PLATES THINNER THAN INDICATED IN THE CHART. WHEN LIFTING TUBES WITH A THIN WALL, THE LENGTH MAY BE THE LIMITING FACTOR.

Permanent Magnetic Parts Lifter

MPI's Permanent Magnetic Parts Lifter is designed for ferrous parts and the direct replacement of vacuum cups located on ferrous parts transfer systems. A powerful rare earth magnet is activated by air pressure. An air solenoid controls both on and off operation by connecting flexible airlines to the quick disconnect fittings. Short bursts of air ranging from 40-60 PSI, is all that is required to operate the unit.

MPI's exclusive "Fail Safe" feature is built into each magnet. Once the powerful permanent magnet is engaged, only air pressure in the reverse "off" direction will disengage the unit, even if the airline is disconnected or loses pressure. This process ensures a positive connection between the parts and the working surface of the Permanent Magnetic Parts Lifter.

Standard Features:

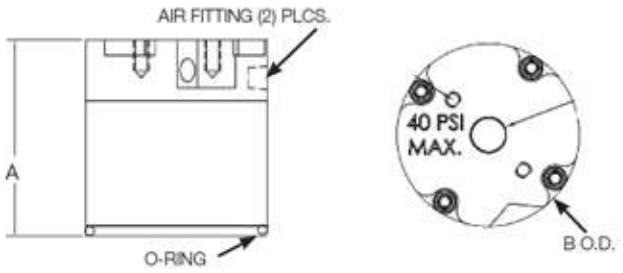
- CNC Machined from T-6061 Billet Aluminum
- MPI's exclusive replaceable and easy to change O-ring non-marring face
- Low air consumption and quiet operation
- Air supply controls positive part pick up and release with no internal spring unlike other brands
- Longer lasting solution compared to vacuum cups
- Standard 3/8-NPT thread for retro-fitting to existing end effectors
- Unit is provided with:
  (1) 1/8" NPT Pipe Plug
  (1) 3/8" NPT Pipe Plug
  (1) 3/8" NPT X 1.500" Black Pipe Nipple

Optional Features:

- Steel Airline Fittings
- Non-Standard Unit Sizing
- Suction Cup Adapter Plate, for simple retro-fit applications on existing lines
- Custom magnetic circuits to meet customer specific applications available on request

PMPL Model #	Height	Diameter
PMPL-175-250-REN-S	2.50"	1.75"
PMPL-300-350-REN-S	3.50"	3.00"
Holding Values		
Material Gauge	PMPL-175-250-REN-S	PMPL-300-350-REN-S
26 Gauge	5.0 lbs	20.5 lbs
18 Gauge	5.25 lbs	30.5 lbs
12 Gauge	6.0 lbs	34.0 lbs
7 Gauge	6.5 lbs	36 lbs.

All values are maximum breakaway. To maintain safety standards, lift magnets should be used at 1/3 of their breakaway capacity.



The Proper Ways to Use a Lift Magnet

Common Lift Magnet Performance Loss and Failures Factors

- Blunt force impacts, such as dropping, or banging on the magnet, can cause fractures in the magnet
- High heat: If the magnet is exposed to temperatures above its' capabilities, it will lose magnetism
- Exposure to electrical fields, like generators or welding ground circuits, will result in loss of magnetism
- External factors that influence a lift magnet's performance are nicks, scratches, gouges, rust, etc. to the contact surface of the lifter
- Breakaway testing will prove the magnet is performing at the intended Working Load Limit (WLL)

Why Should I Use a Lift Magnet Testing and Certification Service?

Lift Magnets cannot be visually inspected alone. Lifting Magnet failure is often the result of internal damage to the magnetic material. A simple visual inspection, which can be performed on other lifting devices, will not uncover this type of damage. MPI's Lift Magnet Testing and Certification Service performs a thorough visual inspection and functional testing of magnetic lifting products. The service uses testing techniques and equipment that meets or exceeds the ASME B30.20 Standards for Below-the-Hook Magnetic Lifting Devices. These performance tests are often referred to as Breakaway tests.

Proper breakaway testing of a lift magnet determines the maximum lift capacity of the magnet under ideal conditions. This allows the lift the operator/owner to determine if the magnet meets the rated Working Load Limit (WLL) or lift capacity as designed by the manufacturer. After testing, MPI provides documentation of the testing and if the magnet meets the manufacturer's labeled rating, a certificate of conformance.

Important Items to Consider When Operating a Lifting Magnet

Always

- Instruct new operators to read the relevant manual before use
- Use the entire work surface of the lifter
- Fully engage the lifter in the ON position before lifting the load
- Wear suitable protective gear when using the equipment
- Maintain the lifter work surface in good condition
- Check the suitability of equipment used in conjunction with the lifter
- Adhere to the safe working load information specified

Never

- Lift or transport people
- Lift loads while people are in the maneuvering space
- Allow untrained personnel to operate the lifter
- Leave a load unattended
- Attempt to switch the lifter before setting the load down
- Position yourself beneath the lifted load
- Bring the load to a sharp stop
- Lift a load outside of the specified safe workload of the lifter
- Lift a load with dimensions outside those specified for the lifter
- Lift an unbalanced load
- Operate the lifter in temperatures higher than 80ºC (176ºF) or lower than -10ºC (14ºF)
- Operate the lifter in humidity higher than 80%
- Operate the lifter in explosive (EX) or static sensitive environments
- Submerse the lifter in water

Magnetic Chucks

Magnetic chucks are modern devices replacing vices, mechanical clamps, and fixtures. Using electromagnetic, electropermanent, and permanent magnetic chucks for clamping and unclamping of the machined components saves time, allows the workpiece to be accessible from five (5) sides, and does not damage the product.

A key advantage of magnetic chucks for workholding is consistent clamping. Unlike mechanical clamps and vises, there are no variations on how tightly the workpiece is held. Full support of the workpiece is another advantage of magnetic checks. For example, if toe clamps are used on the outer surfaces of a workpiece, supporting the center of the piece is a challenge. These unsupported areas can chatter, resulting in increased cycle time.

Rectangular Permanent Magnetic Chucks

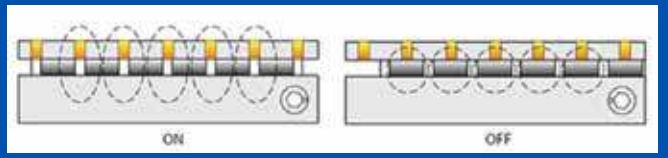
MPI Difference	Solid design, waterproof High stability and chuck accuracy during surface grinding Clamp even the thinnest parts Long life span due to the fixed top plate, which can be re-ground many times. Easy operation with low maintenance. Durable switching mechanism Manufactured in Europe to the highest quality standards	Double neodymium magnet system Versatile permanent magnetic chuck for use in grinding and light milling High durability and long-life span of the top plate made of steel/stainless steel Robust and durable steel base for precise machining Waterproof design is immersible in dielectric liquid during EDM machining Manufactured in Europe to the highest quality standards	Compact dimensions and a high holding force High use-value and long-life span thanks to an unparalleled regrinding limit Holding surface with uniform distribution of the magnetic force right up to the edges Waterproof design Manufactured in Europe to the highest quality standards

Permanent Magnetic Chucks

Permanent magnetic chucks are comprised of highly energized magnetic and ferromagnetic materials, which attract the magnetic steel when used in a certain configuration. Magnets do not lose their magnetic force under normal conditions. Activation and deactivation (switching ON/OFF) is carried out mechanically, by removing the interior system with permanent magnets. A manual lever is used for this action.

Advantages of Permanent Magnetic Chucks

- No dependence on electric power, safe, with no combined expenses.
- Easy installation and quick removal of the chuck onto another machine.
- No heat generation and thermal deformation of the top plate, which allows very precise machining.
- Usually has a dense pole pitch, very suitable for small and extra-small components.
- Solid construction, virtually maintenance-free, with a long-life span.
- Relatively low purchase costs.



Limitations of Permanent Magnetic Chucks

- Limitation of chuck size, usually up to 12” x 24” in size.
- Less to no control of the holding force.
- The mechanical system is less suitable for automated processes.

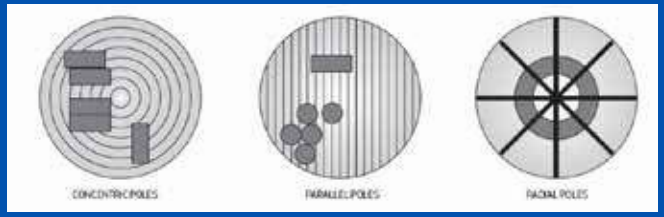
Rectangular or Round Chuck? Selecting the Best Chuck for the Application

Your component should cross as many poles as possible to achieve the greatest holding power. To select a chuck shape, consider the application (grinding, milling, drilling, EDM, etc.,) and the range of sizes and thicknesses of the parts that will be held. The maximum holding force is only reached if the part can conduct all available magnetic flux from the magnet pole. If the workpiece thickness is smaller than 50 % of the pole width, the holding force will be weaker.



Round Permanent Magnetic Chucks

Permanent Magnet	Rare Earth Round Chuck	Double Rare Earth Round Chuck
Technology	Permanent	Permanent

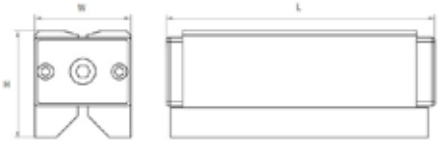
Magnetic Permanent Blocks

Magnetic Permanent Blocks (MPB) are an excellent tool for attaching components during surface machining or welding. The magnetic blocks offer flexible attachment without disturbing contours for easy drilling, deburring, fine grinding, and mounting work. The magnetic permanent block chucks are completely nickel-coated for high resistance to corrosion. The blocks are sold as a pair (two) and contain a switching key.

Application: Clamping
Technology: Permanent
Block Dimension: From 2.52 x 5.6 x 3 in
Holding Force: up to 10kN/cm2
Clamping Surfaces: Three sides



Part Number	Width (IN)	Length (IN)	Height (IN)	Clamping Area 1 (IN)	Clamping Area 2 (IN)	Holding Force (kN)	Weight (LBS)
MPB-500	2.5	5.6	2.8	4.72 x 2.24	5.35 x 2.52	5	17.2

Pole Type	Parallel	Transverse
Magnetic System Warranty	1 year	1 year
Use	For clamping of one or more ferromagnetic workpieces on surface grinding machines during dry or wet (coolant) grinding. This chuck can also be used at checking and assembling workplaces.	For clamping small and large workpieces during precise surface grinding
MPI Difference	Design with firmly embedded coils Waterproof design Variable adjustment of the force to create the optimum conditions for clamping Suitable for sinker EDM applications Magnetic field does not affect EDM operation Powerful holding over entire chuck surface Fine pole divisions Low height Manufactured in Europe to the highest quality standards	Design with firmly embedded coils Waterproof design Electromagnet is easily operated by pressing the button on the control unit Variable adjustment of the force to create the optimum conditions for clamping High nominal holding force Multi core magnetic system generates an efficient and uniform magnetic field over the entire surface of the chuck Manufactured in Europe to the highest quality standards
	Note: Control Unit sold separately	

Electromagnetic Chucks

The magnetic field in an electromagnetic chuck is generated by coils through which a rectified current flows. There are ferromagnetic cores inside the coils. These cores are magnetized by the electric current. Electromagnets are activated by the control unit, which makes it possible to vary the force of the magnet and the demagnetization of the workpiece.

Advantages of Electromagnetic Chucks

- Depending on the coil size, the electromagnets can generate a very strong magnetic field, which means firm clamping of the load.
- Due to the high magnetic field, it is also possible to reliably clamp uneven loads with larger gaps between the load and the chuck.
- The chuck can be supplemented with advanced control systems for fluent control of the force of the magnet and control of the demagnetization cycle. This results in simple removal of the workpiece from the chuck.
- It is possible to make any chuck size depending on the workpiece size.
- Operation of the magnets can be manual, automatic, or a combination.

Limitations of Electromagnetic Chucks

- The magnet needs a continuous power supply. Interruption leads to loss of holding force.
- Regarding application, an emergency power supply may be required.
- The current in the coils generates heat, which limits the accuracy.

Electropermanent Chuck

Electropermanent Chuck	Mastermilling Chuck
Technology	Electropermanent
Included with Each Magnet	Supplied with two (2) side stoppers and 6m/20' armored cable
Holding Force	170N/cm² / 246 lbs/in²
Minimum Workpiece Size	50mm x 110mm x 20mm / 2"x4.3"x0.787"
Recommended Workpiece Thickness	minimum 12mm/ 0.47"
Regrinding Limit	6mm / .236"
Pole Size	50mmx50mm / 2"x2"
Pole Type	Square
Magnetic System Warranty	1 year
Use	Milling material - can be machined from five (5) sides, drilled through, and uneven material can be machined as well using pole extensions
MPI Difference	Slot round the entire perimeter for easy attachment to machine table Stop blocks can be moved freely to any side Option to connect set of magnets to a single control unit Shown with optional square pole extensions Quick push-pull connector Manufactured in Europe to the highest quality standards
	Note: Control Unit sold separately

Electropermanent Chucks

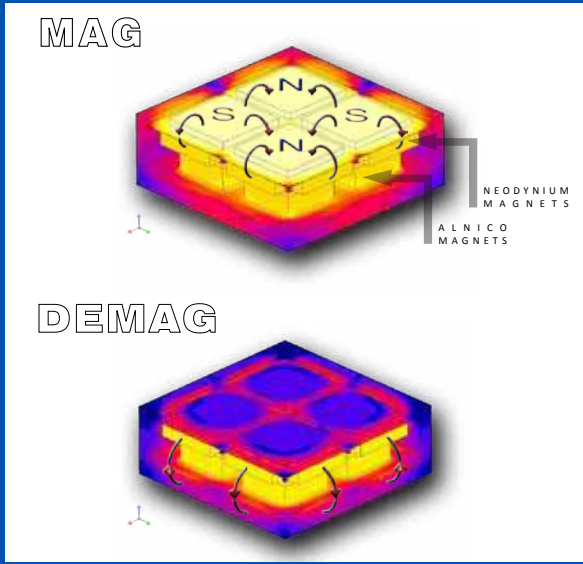
Electropermanent handling systems use a combination of permanent and electromagnetic technology. They are built on the ability of certain ferromagnetic materials to become a permanent magnet based on the short action of a strong direct current. They remain in this state without an external power supply. During the demagnetization process, pulses of alternating current will demagnetize the ferromagnetic materials again. An electric current is only needed for clamping/unclamping the load.

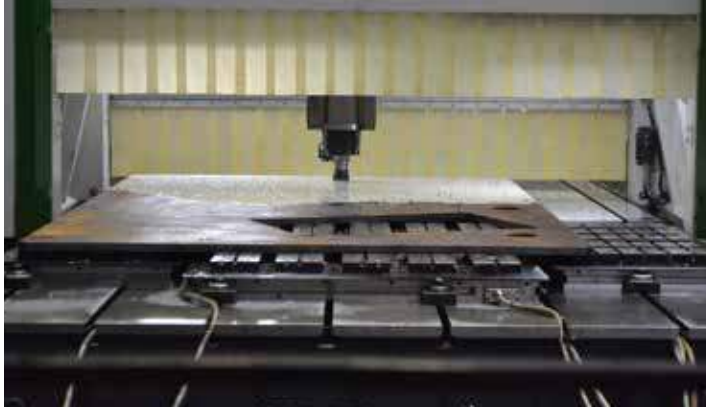
Advantages of Electropermanent Chucks

- High holding force, which makes it possible to apply heavy milling operations.
- High level of safety in terms of independence of electric power. The workpiece will not be released even after disconnecting the power supply.
- Minimum electrical consumption, used for switching ON/OFF only.
- Operation using the control unit allows its application in automated system operations.
- The temperature in the chuck does not change in the OFF/ON positions, which means there are no negative effects caused by different temperatures.
- It is possible to design and manufacture any system regardless of size, delivering customized solutions.

Limitations of Electropermanent Chucks

- Higher price than that of permanent chucks.
- Compared to electromagnets, there is a higher sensitivity to the air-gap between the chuck and the component to be clamped.
- When a malfunction occurs in the control unit, the load can remain clamped.





Pole extensions sold separately

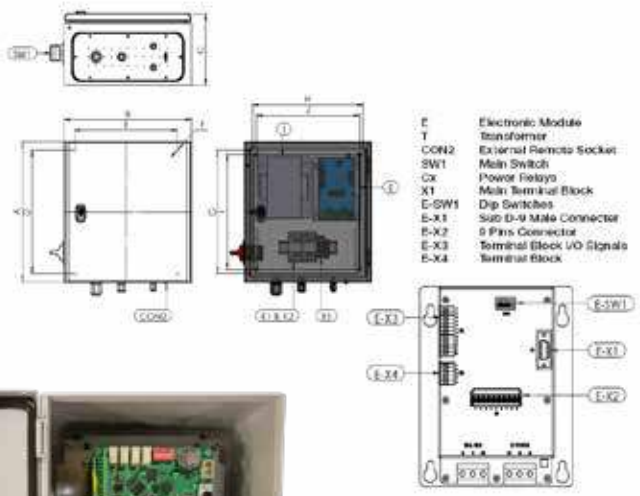
Electromagnet Control Unit

Electromagnet Chuck Control Units are designed to magnetize and demagnetize electromagnetic devices such as electromagnetic chucks and lifters. Magnetization consists of supplying a continuous DC output voltage to the device. Demagnetization cycles consist of a specific combination of positive and negative voltage pulse(s). The workpiece material may retain some residual magnetism due to its chemical and magnetic properties. The control units are designed to operate any 110VDC magnetic device within the specified wattage.



MPI's Electromagnet Control Unit features an SR interlock safety contact. By using a potential free relay contact driven by the machine's PLC, the controls can be enabled or disabled. The safety contact closes when the magnetic device is properly magnetized and should be used to enable the operation of the connected machine. A 24V signal on E-X3-10 of the control board provides a warning signal to disable the control unit. The safety control unit feature should be engaged during machining or transport.

Key Features:

- Clamping force control for higher accuracy and colder operation
- Demagnetization of the chuck and workpiece for easy unclamping
- Powerful control system with a microprocessor
- 150W and 630W Models Stock, all others special order
- Choose a design – metal box (IP54 stock) or panel (IP00 special order)
- One (1) year warranty

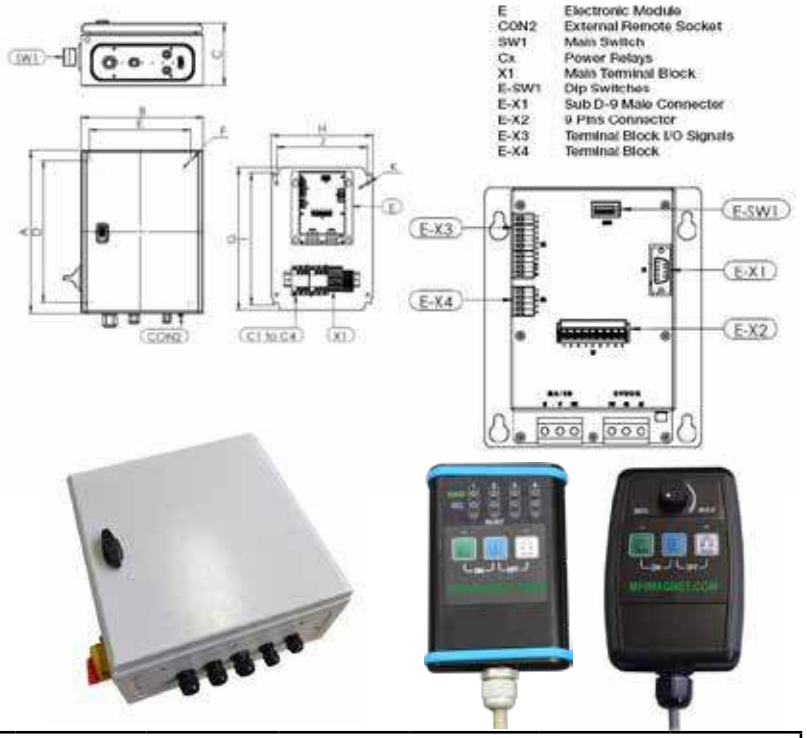
ElectroPermanent Control Unit

The ElectroPermanent power supply and control units are designed to magnetize and demagnetize all types of ElectroPermanent magnetic devices, depending on factory settings. MPI offers several control units, depending upon size and the number of chucks. In case of other magnetic device brands and models, consult MPI. EPCU control units are named by the number of output channels (i.e., number of electrical circuits to be energized in the magnetic clamping system): EPCU10: 1 channel, EPCU20: 2 channels, and EPCU40: 4 channels.



Key Features:

- EPCU control units come in two different versions:
  - SW for single wave rectified output voltage
  - DW for double-wave (full wave) rectified output voltage
- Operational safety – the machine cannot be started up at a low holding force
- Safe magnetization level setting
- Effective demagnetization of the chuck and the workpiece for easy removal
- Control of the chuck via remote controller available
- Control one or more magnets at the same time (depending on selected unit type)
- One (1) year warranty
- Models 10SW and 10DW use U19 Control style. All other models use RM control style.
- U19: No channel selection possible but it can be used with EP-CU20 and 40
- Mag and demag cycles will start for all channels
- RM : Channel selection possible

Model SW for Single-Wave Rectified Output Voltage

Part Number	Description	Number of Chucks & Size (IN)	Main operating voltage (Vac)	Main operating frequency (Hz)	Operating temperature (F)	Max. relative humidity	Max. working altitude (FT)	Cabinet protection class	Required circuit breaker	Required power cable (*)	Number of output channels

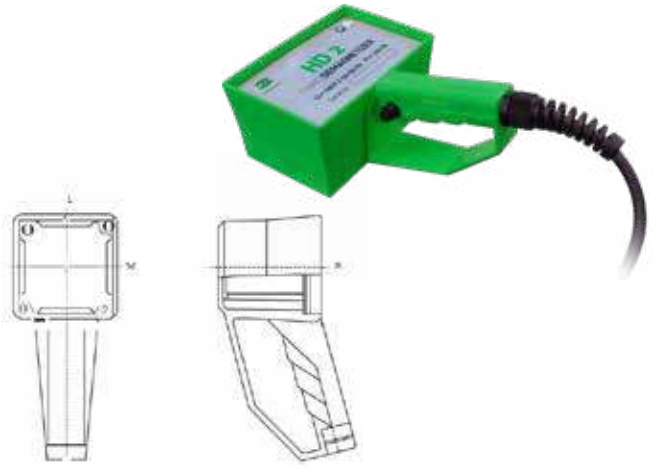
Demagnetizers

Some materials retain residual magnetism if exposed to magnetic fields. The amount depends on the workpiece size and the type of material. To remove this undesirable residual magnetism, the object must be exposed to an alternating magnetic field, which eliminates the magnetism to the lowest possible value.

Magnetized workpieces cross the electrical plane, exposing the workpiece to an opposite magnetic field and creating an irregular magnetic field. By slow movement across the top plate and away, the unwanted residual magnetism is effectively removed from the object.



Demagnetizer	Handheld	Tabletop
Technology	Electropermanent	Electropermanent
Included	110 VAC 10ft power supply cable with plug	110V/60Hz 352 VA 10 ft power supply cable with plug
Duty Cycle	20%, maximum operating time 10 minutes	-
Operation	Pushbutton	Double pole switch with signal light
Magnetization power	high	-
Depth of demagnetization field	up to 1.57 in	Field penetration up to 1.57”
Warranty	1 year	1 year
Use	For large or complex components, such as molds, bearings, and various machine and mechanical parts, etc. It is an efficient tool where quick and mobile demagnetization is needed.	For quick and simple demagnetization of flat and small cylindrical components. Easily integrated into a production line, for instance under a conveyor belt.
MPI Difference	Lightweight plastic structure with large handle Push button, simple operation Compact dimensions for mobility Two styles depending upon thickness and dimension of workpiece to be demagnetized Manufactured in Europe to the highest quality standards	Lightweight aluminum body Stainless steel top plate Double pole switch with signal light Three styles available Enlarge work area by adding more demagnetizers side by side Manufactured in Europe to the highest quality standards

Sheet Separators

Made in USA

MPI sheet separators are designed to improve productivity and employee safety in sheet handling operations. These magnets can also provide significant benefits in reducing costs by eliminating “doubles” when handling oily, sticky, or prefinished sheet stock in an automated stamping, forming, or blanking operation. Sheet separators utilize the basic laws of magnetic “like poles” repelling characteristics in their use and operation. By inducing “like” magnetic fields into a stack of steel sheets or plates, repelling forces are created from sheet to sheet, forcing them to separate from each other.

Model	Operation	Material	Cost	Installation
SS	Always on	Ceramic	•	Bolt to floor or pallet
STSS	Manual on/off	Rare Earth	••	Pallet pin
PAFM	Automated	Rare Earth	•••	Flexible (floor, pallet pin or robotic)

Reference specific datasheets for guides on proper model selection. Refer to www.mpimagnet.com for other available sizes.

Manual Sheet Separator (SS)

Permanent, always "on" design is the most economical solution and should be sized for the maximum height of the stack.

Sheet Sizes (in)	Sheet Metal Thickness

Shown with optional bracket

Pneumatic Automated Fanner Magnet (PAFM)

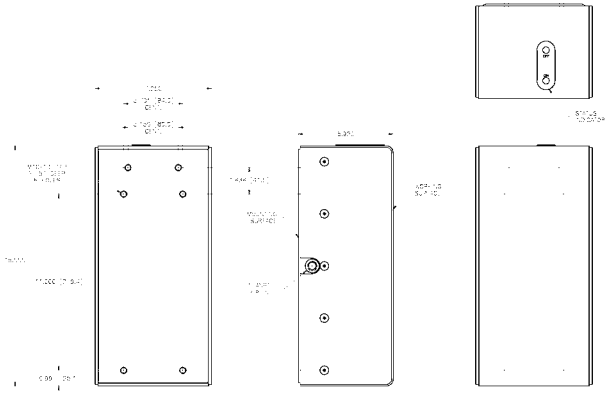
Automated fanner magnets are designed for high-volume, PLC-operated production lines. Unlike traditional sheet separators, an exclusive rack and pinion system rotates the magnet away from the unit face, totally eliminating any residual magnetic field and allowing for safer and more consistent movement of metal sheets.

Pneumatic automated fanner magnets utilize one of the basic laws of magnetics: like poles repel and opposites attract. By inducing “like” magnetic fields into a stack of steel sheets or plates, repelling forces are created from sheet to sheet, forcing them to separate. When a new stack is positioned, the magnet is turned on and sheeting fanning occurs, requiring no operator interface with the magnets.

The fanners are made from a powerful rare earth permanent magnet material with steel and stainless steel housing.

Key Features:

- Designed specifically for fully automated production lines
- Eliminates any residual magnetic field when off
- Increases productivity and efficiency
- Enables easier handling of oily, sticky, and/or polished sheets
- Powerful rare earth magnet for fanning large sheets
- Compact and lightweight design for simple mounting to end-of-arm tooling
- Pallet pin mounting bracket available
- Loss of air returns magnet to “safe” handling position, alleviating potential injury



Part Number	Magnet Area (IN)	Overall Width (IN)	Overall Height (A) (IN)

Pallet Pin Stack Tracker (STSS)

The Pallet Pin Stack Tracker (STSS) series is the safest manually operated sheet separator available. These units properly separate sheets while eliminating pinch points during operation. Simply slide the housing over the pin and attach the Stack Tracker to the side of the stack of blanks, near the top. As blanks are removed, the Stack Tracker will work its way to the bottom of the stack, fanning individual blanks as it moves.

The Stack Tracker significantly increases uptime by eliminating the possibility of double sheets when handling oily, sticky, or pre-finished blanks in automated stamping, forming, and shearing operations. A safety version with On/Off switch to eliminate unintended operation is also available.

Key Features:

- Powerful rare earth magnet material
- 100% stainless steel housing
- Dual handle safety feature
- Lightweight, rugged design
- Automatic adjustment as stack decreases
- Safety cover around moving parts to eliminate pinched fingers

Optional Features:

- Special mounting available
- Replaceable wear strips
- Safety on/off switch

Stack Tracker - STSS Series

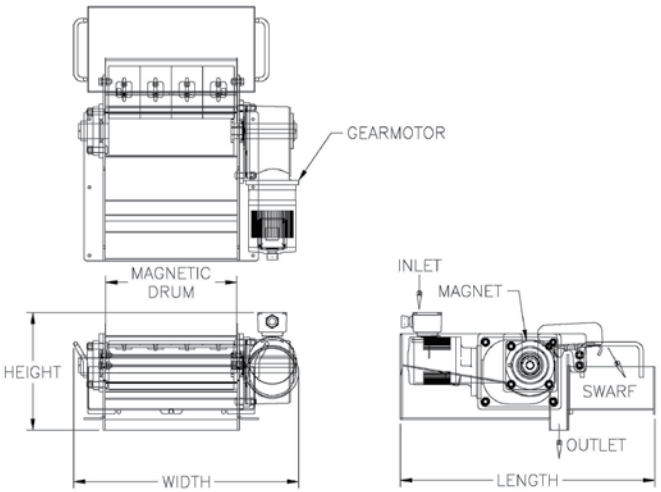
Magnetic Filtration

Coolant Cleaner

MPI's Coolant Cleaner is a continuous cleaning magnetic separator that removes ferrous material from the coolant flow and deposits it into a disposal bin. This CC-series cleaner is ideal for production runs of ferrous material on cutting and grinding machine tools and works with water based coolants or straight cutting oils. Both cost effective and durable, this separator extends the life cycle of machine tools and coolant. It provides increased productivity with less downtime for machine coolant replacement.



With simple, automatic cleaning, the powerful Ceramic 8 magnet drum sits partially submerged in the coolant flow so that all liquid comes into contact with the high intensity magnetic field. Ferrous contaminant attaches itself to the rotating drum, where it is then continuously cleaned by a profiled scraper. The contaminant is pushed along the scraper until it falls into a bin. As the contaminant is pushed along the scraper, it compresses and excess liquid drains back into the tank, leaving the solids almost dry.

Key Features:

- Unique magnetic drum that is fully energized along its width and diameter
- Automatic and continuously self-cleaning
- 120 VAC standard
- Optional Rare Earth Magnetic Roll
- CC-series separator can be integrated with other purifiers to provide a very efficient filtering system

Made in USA

Coolant Cleaner Specifications

Model	Approx. Capacity/GPM				Magnetic Drum Size				Approx.	
	Water Soluble		Oil 100 SSU		Diameter		Width

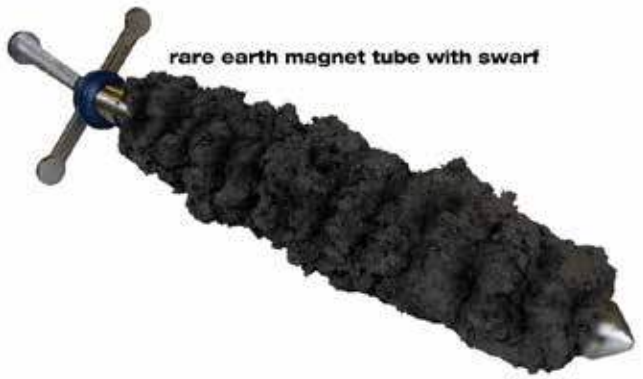
Contamination Scale: Light to Medium = approx. 1/8 lb per gallon
Medium to Heavy = approx. 1/8 lb to just under 1/2 lb per gallon

Filter Bag Magnet

Made in USA

Filter Bag Magnets (FBM) collect ferrous metal that would otherwise be collected in the bag filter. Installing a high-performance MPI rare earth filter bag magnet inside the bag filter significantly reduces the frequency required to clean and replace bag filters. This saves money and time. Implementing a magnetic bag filtration system allows the liquid to flow around the magnetic field and capture any ferrous particles in a magnetic trap. The magnetic tube filter is then removed, cleaned, and readied for reinsertion into the bag filter to be used again. The powerful magnet reduces the tramp metal that plugs and cuts filter bags.



Key Features:

- High performance rare earth magnetic circuit generates over 10,000 gauss on product contact area for maximum tramp metal retention, significantly outperforming ceramic and alnico designs
- Liquid tight, fully welded design ensures no water ingress, which can damage the magnet
- Full length magnetic tube maximizes tramp metal retention
- Quality tested and certified to performance standard ordered prior to shipment (Certificate included with shipment)
- Heavy wall thickness tube for high durability
- Nonmetallic stripper for easy cleaning of magnetic tube
- Clover handle grip and centering device
- Multiple designs to fit every budget and performance requirement
- Industry leading lead time for delivery as short as 24 hours for custom sizes and configurations

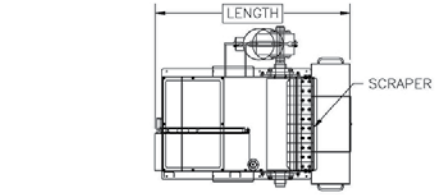
Eco-Flow

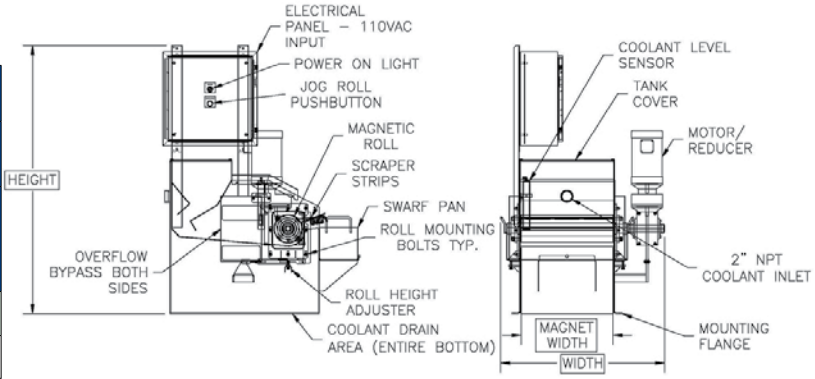
Eco-Flow provides true plug and play filtration. The fluid intake system keeps coolants calm, allowing contaminants to contact the roll at a low velocity for improved magnetic filtration. MPI's integrated, indexing magnetic roll never needs replacement. Eco-Flow's adjustable blades allow for maximum magnet cleaning and coolant recapture, eliminating the need for plastic squeegees. Eco-Flow also features an automatic coolant level sensor that monitors the level of incoming fluid to maximize filtration and avoid coolant overflow. There is also a bypass that eliminates potential spills in case of electrical or mechanical failure. Surrounding areas stay clean and potential accidents are prevented with Eco-Flow.

The Eco-Flow is a continuous cleaning magnetic separator that removes grinding swarf and other contaminants from coolants and deposits them directly into a disposal bin, eliminating the costs associated with collecting, transporting, and dumping waste materials. As swarf is removed, fluids are fed automatically back into the reservoir tank. An extremely dry swarf "cake" is produced. A drier cake means fewer messy, oily pools around machinery, and improved coolant recovery, reducing consumable costs. Magnetic technology is green, and substantially reduces both the need to buy costly consumables and the associated downtime required to change paper filters.

Key Features:

- System ships complete with magnetic roll, scraper system, fluid tank, inlet port (sized to specifications), and controls
- Plugs into a standard 110V outlet
- High intensity rare earth magnetic material traps contaminants
- Stainless steel construction
- Automatic and continuous self-cleaning
- Custom sizes and configurations available





Eco-Flow

Eco-Flow Specifications*

Model Number	GPM		Magnet Roll Width		Unit Length		Unit Height		Unit Width		Unit Weight	
	Water Based	Oil Based**	IN	CM	IN	CM	IN	CM	IN	CM	LBS	KG
Eco-Flow 7	29	15	7	17.8	41.2	104.6	56.7	144	21.3	54.1	500	227
Eco-Flow 11	46	23	11	27.9	41.2	104.6	56.7	144	25.3	64.3	550	250
Eco-Flow 19	80	40	19	48.3	41.2	104.6	56.7	144	33.3	84.6	600	272
Eco-Flow 38	160	80	38	96.5	41.2	104.6	56.7	144	52.3	132.8	650	295

*For highest performance separation, derate 20 - 25%. Rates shown are based on physical capacity.
Lower rates may be required, depending upon flow characteristics, volume of contaminants and efficiency desired.
**Up to 100 SSU.

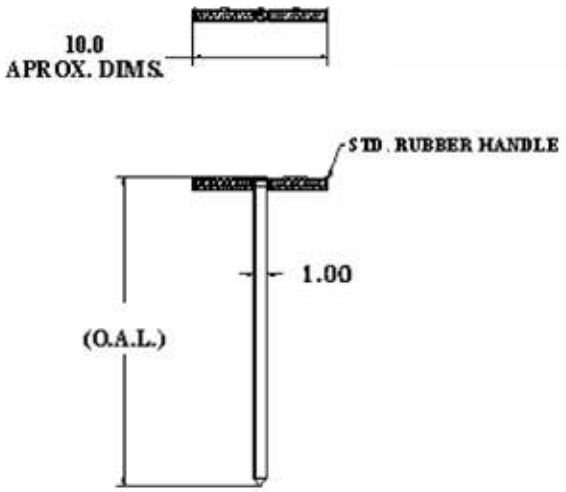
Magnetic Tube Probe

MPI Magnetic Tube Probes are used to test bulk-product containers for ferrous contamination prior to processing and to remove ferrous materials from product in hard-to-reach areas. Simply insert the probe into the product in several locations. Remove it slowly to check for ferrous particles on probe. They are easy to clean by wiping the probe with a clean rag.

Key Features:

- 304 Stainless Steel construction
- 1” diameter stainless steel tubing with 6” of magnet area at end of probe
- T-bar handle with rubber grips
- Permanent Ceramic 8 or Rare Earth magnet material

Made in USA



Magnetic Tube Probe Selection Guide		
Part Number	**Magnet Material**	**Overall Length (IN)**
MTP 124	Ceramic	24

MPI employees celebrate 40 years of business operations in 2021

Working With MPI

MPI Automation and Workholding products are sold exclusively through our select Industrial Distribution Network and supported by a nation-wide group of Independent Manufacturer's Representatives trained to help you select the right magnetic system for your application.

At MPI, we are always ready to work with you to select the right magnet for the job. We can help with additional specifications, drawings, and all available technical information. Supported by an extensive inventory, MPI will assist with your standard application or help design a custom magnetic system.

Working for You

MPI service programs are designed with the customer in mind. Each package is customized to address all major points of concern when maintaining metal control equipment.

MPI has an option for every customer need, requirement, and budget to make protecting your investment affordable and attainable.
